Chapter 1

Main Page

This is the main page for the Schwarz library pdf documentation. The repository is hosted on `github`. Documentation on aspects such as the build system, can be found at the Installation Instructions page.

Modules

The structure of the Schwarz Library code is divided into different `modules` :

- Initialization : Handles the initialization of the problem and the solver.
- Communicate : Handles the communication.
- Solve : Handles the local solution and the convergence detection.
- Schwarz Class : The Classes related to the Schwarz solvers.
- Utils : Provides some basic utilities.

Chapter 2

Installation Instructions

Building

Use the standard cmake build procedure:

```
mkdir build; cd build
cmake -G "Unix Makefiles" [OPTIONS] .. && make
```

Replace `[OPTIONS]` with desired cmake options for your build. The library adds the following additional switches to control what is being built:

- `-DSCHWARZ_BUILD_BENCHMARKING={ON, OFF}` Builds some example benchmarks. Default is `ON`
- `-DSCHWARZ_BUILD_METIS={ON, OFF}` Builds with support for the `METIS` partitioner. User needs to provide the path to the installation of the `METIS` library in `METIS_DIR`, preferably as an environment variable. Default is `OFF`
- `-DSCHWARZ_BUILD_CHOLMOD={ON, OFF}` Builds with support for the `CHOLMOD` module from the Suitesparse library. User needs to set an environment variable `CHOLMOD_DIR` to the path containing the `CHOLMOD` installation. Default is `OFF`
- `-DSCHWARZ_BUILD_CUDA={ON, OFF}` Builds with CUDA support. Though Ginkgo provides most of the required CUDA support, we do need to link to CUDA for explicit setting of GPU affinities, some custom gather and scatter operations. Default is `OFF`.
- `-DSCHWARZ_BUILD_CLANG_TIDY={ON, OFF}` Builds with support for `clang-tidy` Default is `OFF`
- `-DSCHWARZ_BUILD_DEALII={ON, OFF}` Builds with support for the finite element library `deal.ii` Default is `OFF`
- `-DSCHWARZ_WITH_HWLOC={ON, OFF}` Builds with support for the hardware locality library used for binding hardware. `hwloc` is distributed as a part of the Open-MPI project. Default is `ON`
- `-DSCHWARZ_DEVEL_TOOLS={ON, OFF}` Builds with some developer tools support. Default is `ON`. In particular uses `git-cmake-format` to automatically format the source files with `clang-format`.

Tips

- If you are having CUDA problems and you are not using CUDA, then feel free to switch the CUDA module off with `-DSCHWARZ_BUILD_CUDA=off`.
- Installing CHOLMOD can be a bit annoying. TODO add some details on fixing Suitesparse compilation.
- When doing merge commits it is possible that make format does not work. You can run `cmake -DSCHWARZ_DEVEL_TOOLS=OFF ..` to temporarily switch off the formatting. Please switch it on again when committing normally.

Chapter 3

Testing Instructions

Chapter 4

Benchmarking.

Benchmark example 1.

Poisson solver using Restricted Additive Schwarz with overlap.

The flag `-DSCHWARZ_BUILD_BENCHMARKING` (default `ON`) enables the example and benchmarking snippets. The following command line options are available for this example. This is setup using `gflags`.

The executable is run in the following fashion:

“‘sh [MPI_COMMAND] [MPI_OPTIONS]

Chapter 5

Module Documentation

5.1 Communicate

A module dedicated to the Communication interface in schwarz-lib.

Namespaces

- SchwarzWrappers::CommHelpers

  The CommHelper namespace .
- ProcessTopology

  The ProcessTopology namespace .

Classes

- class SchwarzWrappers::Communicate< ValueType, IndexType >

  The communication class that provides the methods for the communication between the subdomains.
- struct SchwarzWrappers::Metadata< ValueType, IndexType >

  The solver metadata struct.

5.1.1 Detailed Description

A module dedicated to the Communication interface in schwarz-lib.

5.2 Initialization

A module dedicated to the initialization and setup and usage of the solvers in schwarz-lib.

Namespaces

- SchwarzWrappers::PartitionTools

  The PartitionTools namespace .
- ProcessTopology

  The ProcessTopology namespace .

Classes

- class SchwarzWrappers::device_guard

  This class defines a device guard for the cuda functions and the cuda module.
- class SchwarzWrappers::Initialize< ValueType, IndexType >

  The initialization class that provides methods for initialization of the solver.
- struct SchwarzWrappers::Settings

  The struct that contains the solver settings and the parameters to be set by the user.
- struct SchwarzWrappers::Metadata< ValueType, IndexType >

  The solver metadata struct.

5.2.1 Detailed Description

A module dedicated to the initialization and setup and usage of the solvers in schwarz-lib.

5.3 Schwarz Class

A module dedicated to the Schwarz solver classes in schwarz-lib.

Classes

- class SchwarzWrappers::SolverRAS< ValueType, IndexType >

  An implementation of the solver interface using the RAS solver.
- class SchwarzWrappers::SchwarzBase< ValueType, IndexType >

  The Base solver class is meant to be the class implementing the common implementations for all the schwarz methods.

5.3.1 Detailed Description

A module dedicated to the Schwarz solver classes in schwarz-lib.

5.4 Solve

A module dedicated to the solvers including local solution and convergence detection in schwarz-lib.

Namespaces

- SchwarzWrappers::ConvergenceTools

  The ConvergenceTools namespace .
- SchwarzWrappers::SolverTools

  The SolverTools namespace .

Classes

- struct SchwarzWrappers::Metadata< ValueType, IndexType >

  The solver metadata struct.
- class SchwarzWrappers::Solve< ValueType, IndexType >

  The Solver class the provides the solver and the convergence checking methods.

5.4.1 Detailed Description

A module dedicated to the solvers including local solution and convergence detection in schwarz-lib.

5.5 Utils

A module dedicated to the utilities in schwarz-lib.

Classes

- struct SchwarzWrappers::Utils< ValueType, IndexType >

  The utilities class which provides some checks and basic utilities.

5.5.1 Detailed Description

A module dedicated to the utilities in schwarz-lib.

Chapter 6

Namespace Documentation

6.1 ProcessTopology Namespace Reference

The ProcessTopology namespace .

6.1.1 Detailed Description

The ProcessTopology namespace .

proc_topo

6.2 SchwarzWrappers Namespace Reference

The Schwarz wrappers namespace.

Namespaces

- CommHelpers

    The CommHelper namespace .
- ConvergenceTools

    The ConvergenceTools namespace .
- PartitionTools

    The PartitionTools namespace .
- SolverTools

    The SolverTools namespace .

Classes

- class Communicate

    The communication class that provides the methods for the communication between the subdomains.
- class device_guard

    This class defines a device guard for the cuda functions and the cuda module.
- class Initialize

    The initialization class that provides methods for initialization of the solver.
- struct Metadata

    The solver metadata struct.
- class SchwarzBase

    The Base solver class is meant to be the class implementing the common implementations for all the schwarz methods.
- struct Settings

    The struct that contains the solver settings and the parameters to be set by the user.
- class Solve

    The Solver class the provides the solver and the convergence checking methods.
- class SolverRAS

    An implementation of the solver interface using the RAS solver.
- struct Utils

    The utilities class which provides some checks and basic utilities.

6.2.1 Detailed Description

The Schwarz wrappers namespace.

6.3 SchwarzWrappers::CommHelpers Namespace Reference

The CommHelper namespace .

6.3.1 Detailed Description

The CommHelper namespace .

comm_helpers

6.4 SchwarzWrappers::ConvergenceTools Namespace Reference

The ConvergenceTools namespace .

6.4.1 Detailed Description

The ConvergenceTools namespace .

conv_tools

6.5 SchwarzWrappers::PartitionTools Namespace Reference

The PartitionTools namespace .

6.5.1 Detailed Description

The PartitionTools namespace .

part_tools

6.6 SchwarzWrappers::SolverTools Namespace Reference

The SolverTools namespace .

6.6.1 Detailed Description

The SolverTools namespace .

solver_tools

Chapter 7

Class Documentation

7.1 BadDimension Class Reference

BadDimension is thrown if an operation is being applied to a LinOp with bad dimensions.

```
#include <exception.hpp>
```

Public Member Functions

- BadDimension (const std::string &file, int line, const std::string &func, const std::string &op_name, std::size↩
  _t op_num_rows, std::size_t op_num_cols, const std::string &clarification)

  Initializes a bad dimension error.

7.1.1 Detailed Description

BadDimension is thrown if an operation is being applied to a LinOp with bad dimensions.

7.1.2 Constructor & Destructor Documentation

7.1.2.1 BadDimension()

```
BadDimension::BadDimension (
             const std::string & file,
             int line,
             const std::string & func,
             const std::string & op_name,
             std::size_t op_num_rows,
             std::size_t op_num_cols,
             const std::string & clarification )  [inline]
```

Initializes a bad dimension error.

Parameters

file	The name of the offending source file
line	The source code line number where the error occurred
func	The function name where the error occurred
op_name	The name of the operator
op_num_rows	The row dimension of the operator
op_num_cols	The column dimension of the operator
clarification	An additional message further describing the error

```
        : Error(file, line,
                func + ": Object " + op_name + " has dimensions [" +
                    std::to_string(op_num_rows) + " x " +
                    std::to_string(op_num_cols) + "]: " + clarification)
    {}
```

The documentation for this class was generated from the following file:

- exception.hpp (e8c4423)

7.2 SchwarzWrappers::Settings::comm_settings Struct Reference

The settings for the various available communication paradigms.

```
#include <settings.hpp>
```

Public Attributes

- bool enable_onesided = false

    Enable one-sided communication.
- bool enable_overlap = false

    Enable explicit overlap between communication and computation.
- bool enable_put = false

    Put the data to the window using MPI_Put rather than get.
- bool enable_get = true

    Get the data to the window using MPI_Get rather than put.
- bool enable_one_by_one = false

    Push each element separately directly into the buffer.
- bool enable_flush_local = false

    Use local flush.
- bool enable_flush_all = true

    Use flush all.
- bool enable_lock_local = false

    Use local locks.
- bool enable_lock_all = true

    Use lock all.

7.2.1 Detailed Description

The settings for the various available communication paradigms.

The documentation for this struct was generated from the following file:

- settings.hpp (e8c4423)

7.3 SchwarzWrappers::Communicate< ValueType, IndexType >::comm_struct Struct Reference

The communication struct used to store the communication data.

```
#include <communicate.hpp>
```

Public Attributes

- int num_neighbors_in
  The number of neighbors this subdomain has to receive data from.
- int num_neighbors_out
  The number of neighbors this subdomain has to send data to.
- std::shared_ptr< gko::Array< IndexType > > neighbors_in
  The neighbors this subdomain has to receive data from.
- std::shared_ptr< gko::Array< IndexType > > neighbors_out
  The neighbors this subdomain has to send data to.
- std::vector< bool > is_local_neighbor
  The bool vector which is true if the neighbors of a subdomain are in one node.
- int local_num_neighbors_in
  The number of neighbors this subdomain has to receive data from.
- int local_num_neighbors_out
  The number of neighbors this subdomain has to send data to.
- std::shared_ptr< gko::Array< IndexType > > local_neighbors_in
  The neighbors this subdomain has to receive data from.
- std::shared_ptr< gko::Array< IndexType > > local_neighbors_out
  The neighbors this subdomain has to send data to.
- std::shared_ptr< gko::Array< IndexType ∗ > > global_put
  The array containing the number of elements that each subdomain sends from the other.
- std::shared_ptr< gko::Array< IndexType ∗ > > local_put
  The array containing the number of elements that each subdomain sends from the other.
- std::shared_ptr< gko::Array< IndexType ∗ > > remote_put
  The array containing the number of elements that each subdomain sends from the other.
- std::shared_ptr< gko::Array< IndexType ∗ > > global_get
  The array containing the number of elements that each subdomain gets from the other.
- std::shared_ptr< gko::Array< IndexType ∗ > > local_get
  The array containing the number of elements that each subdomain gets from the other.
- std::shared_ptr< gko::Array< IndexType ∗ > > remote_get
  The array containing the number of elements that each subdomain gets from the other.
- std::shared_ptr< gko::Array< IndexType > > window_ids

The RDMA window ids.

- std::shared_ptr< gko::Array< IndexType > > windows_from

  The RDMA window ids to receive data from.
- std::shared_ptr< gko::Array< IndexType > > windows_to

  The RDMA window ids to send data to.
- std::shared_ptr< gko::Array< MPI_Request > > put_request

  The put request array.
- std::shared_ptr< gko::Array< MPI_Request > > get_request

  The get request array.
- std::shared_ptr< gko::matrix::Dense< ValueType > > send_buffer

  The send buffer used for the actual communication for both one-sided and two-sided.
- std::shared_ptr< gko::matrix::Dense< ValueType > > recv_buffer

  The recv buffer used for the actual communication for both one-sided and two-sided.
- std::shared_ptr< gko::Array< IndexType > > get_displacements

  The displacements for the receiving of the buffer.
- std::shared_ptr< gko::Array< IndexType > > put_displacements

  The displacements for the sending of the buffer.
- MPI_Win window_recv_buffer

  The RDMA window for the recv buffer.
- MPI_Win window_send_buffer

  The RDMA window for the send buffer.
- MPI_Win window_x

  The RDMA window for the solution vector.

7.3.1 Detailed Description

template<typename ValueType, typename IndexType>
struct SchwarzWrappers::Communicate< ValueType, IndexType >::comm_struct

The communication struct used to store the communication data.

7.3.2 Member Data Documentation

7.3.2.1 global_get

```
template<typename ValueType , typename IndexType >
std::shared_ptr<gko::Array<IndexType *> > SchwarzWrappers::Communicate< ValueType, IndexType
>::comm_struct::global_get
```

The array containing the number of elements that each subdomain gets from the other.

For example. global_get[p][0] contains the overall number of elements to be received to subdomain p and global↩
_put[p][i] contains the index of the solution vector to be received from subdomain p.

Referenced by SchwarzWrappers::SchwarzBase< ValueType, IndexType >::initialize(), SchwarzWrappers::↩
SchwarzBase< ValueType, IndexType >::SchwarzBase(), SchwarzWrappers::SolverRAS< ValueType, IndexType >::setup_comm_buffers(), and SchwarzWrappers::SolverRAS< ValueType, IndexType >::setup_windows().

7.3.2.2 global_put

```
template<typename ValueType , typename IndexType >
std::shared_ptr<gko::Array<IndexType *> > SchwarzWrappers::Communicate< ValueType, IndexType
>::comm_struct::global_put
```

The array containing the number of elements that each subdomain sends from the other.

For example. global_put[p][0] contains the overall number of elements to be sent to subdomain p and global_put[p][i] contains the index of the solution vector to be sent to subdomain p.

Referenced by SchwarzWrappers::SchwarzBase< ValueType, IndexType >::initialize(), SchwarzWrappers::↩
SchwarzBase< ValueType, IndexType >::SchwarzBase(), SchwarzWrappers::SolverRAS< ValueType, IndexType >::setup_comm_buffers(), and SchwarzWrappers::SolverRAS< ValueType, IndexType >::setup_windows().

7.3.2.3 is_local_neighbor

```
template<typename ValueType , typename IndexType >
std::vector<bool> SchwarzWrappers::Communicate< ValueType, IndexType >::comm_struct::is_↩
local_neighbor
```

The bool vector which is true if the neighbors of a subdomain are in one node.

Referenced by SchwarzWrappers::SchwarzBase< ValueType, IndexType >::SchwarzBase(), SchwarzWrappers↩
::SolverRAS< ValueType, IndexType >::setup_comm_buffers(), and SchwarzWrappers::SolverRAS< ValueType, IndexType >::setup_windows().

7.3.2.4 local_get

```
template<typename ValueType , typename IndexType >
std::shared_ptr<gko::Array<IndexType *> > SchwarzWrappers::Communicate< ValueType, IndexType
>::comm_struct::local_get
```

The array containing the number of elements that each subdomain gets from the other.

For example. global_get[p][0] contains the overall number of elements to be received to subdomain p and global↩
_put[p][i] contains the index of the solution vector to be received from subdomain p.

Referenced by SchwarzWrappers::SolverRAS< ValueType, IndexType >::setup_comm_buffers(), and Schwarz↩
Wrappers::SolverRAS< ValueType, IndexType >::setup_windows().

7.3.2.5 local_put

```
template<typename ValueType , typename IndexType >
std::shared_ptr<gko::Array<IndexType *> > SchwarzWrappers::Communicate< ValueType, IndexType
>::comm_struct::local_put
```

The array containing the number of elements that each subdomain sends from the other.

For example. global_put[p][0] contains the overall number of elements to be sent to subdomain p and global_put[p][i] contains the index of the solution vector to be sent to subdomain p.

Referenced by SchwarzWrappers::SolverRAS< ValueType, IndexType >::setup_comm_buffers(), and Schwarz↩
Wrappers::SolverRAS< ValueType, IndexType >::setup_windows().

7.3.2.6 remote_get

```
template<typename ValueType , typename IndexType >
std::shared_ptr<gko::Array<IndexType *> > SchwarzWrappers::Communicate< ValueType, IndexType
>::comm_struct::remote_get
```

The array containing the number of elements that each subdomain gets from the other.

For example. global_get[p][0] contains the overall number of elements to be received to subdomain p and global↩
_put[p][i] contains the index of the solution vector to be received from subdomain p.

Referenced by SchwarzWrappers::SolverRAS< ValueType, IndexType >::setup_comm_buffers(), and Schwarz↩
Wrappers::SolverRAS< ValueType, IndexType >::setup_windows().

7.3.2.7 remote_put

```
template<typename ValueType , typename IndexType >
std::shared_ptr<gko::Array<IndexType *> > SchwarzWrappers::Communicate< ValueType, IndexType
>::comm_struct::remote_put
```

The array containing the number of elements that each subdomain sends from the other.

For example. global_put[p][0] contains the overall number of elements to be sent to subdomain p and global_put[p][i] contains the index of the solution vector to be sent to subdomain p.

Referenced by SchwarzWrappers::SolverRAS< ValueType, IndexType >::setup_comm_buffers(), and Schwarz↩
Wrappers::SolverRAS< ValueType, IndexType >::setup_windows().

The documentation for this struct was generated from the following file:

- communicate.hpp (e8c4423)

7.4 SchwarzWrappers::Communicate< ValueType, IndexType > Class Template Reference

The communication class that provides the methods for the communication between the subdomains.

`#include <communicate.hpp>`

Classes

- struct comm_struct

  The communication struct used to store the communication data.

Public Member Functions

- virtual void setup_comm_buffers ()=0

  Sets up the communication buffers needed for the boundary exchange.
- virtual void setup_windows (const Settings &settings, const Metadata< ValueType, IndexType > &metadata, std::shared_ptr< gko::matrix::Dense< ValueType >> &main_buffer)=0

  Sets up the windows needed for the asynchronous communication.
- virtual void exchange_boundary (const Settings &settings, const Metadata< ValueType, IndexType > &metadata, std::shared_ptr< gko::matrix::Dense< ValueType >> &solution_vector)=0

  Exchanges the elements of the solution vector.
- void local_to_global_vector (const Settings &settings, const Metadata< ValueType, IndexType > &metadata, const std::shared_ptr< gko::matrix::Dense< ValueType >> &local_vector, std::shared_ptr< gko::matrix::↩ Dense< ValueType >> &global_vector)

  Transforms data from a local vector to a global vector.
- virtual void update_boundary (const Settings &settings, const Metadata< ValueType, IndexType > &metadata, std::shared_ptr< gko::matrix::Dense< ValueType >> &local_solution, const std::shared_ptr< gko↩ ::matrix::Dense< ValueType >> &local_rhs, const std::shared_ptr< gko::matrix::Dense< ValueType >> &solution_vector, std::shared_ptr< gko::matrix::Dense< ValueType >> &global_old_solution, const std↩ ::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> &interface_matrix)=0

  Update the values into local vector from obtained from the neighboring sub-domains using the interface matrix.
- void clear (Settings &settings)

  Clears the data.

7.4.1 Detailed Description

template<typename ValueType, typename IndexType>
class SchwarzWrappers::Communicate< ValueType, IndexType >

The communication class that provides the methods for the communication between the subdomains.

Template Parameters

ValueType	The type of the floating point values.
IndexType	The type of the index type values.

Communicate

7.4.2 Member Function Documentation

7.4.2.1 exchange_boundary()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::Communicate< ValueType, IndexType >::exchange_boundary (
            const Settings & settings,
            const Metadata< ValueType, IndexType > & metadata,
            std::shared_ptr< gko::matrix::Dense< ValueType >> & solution_vector )  [pure
virtual]
```

Exchanges the elements of the solution vector.

Parameters

settings	The settings struct.
metadata	The metadata struct.
solution_vector	The solution vector being exchanged between the subdomains.

Implemented in SchwarzWrappers::SolverRAS< ValueType, IndexType >.

Referenced by SchwarzWrappers::SchwarzBase< ValueType, IndexType >::run().

7.4.2.2 local_to_global_vector()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::Communicate< ValueType, IndexType >::local_to_global_vector (
            const Settings & settings,
            const Metadata< ValueType, IndexType > & metadata,
            const std::shared_ptr< gko::matrix::Dense< ValueType >> & local_vector,
            std::shared_ptr< gko::matrix::Dense< ValueType >> & global_vector )
```

Transforms data from a local vector to a global vector.

Parameters

settings	The settings struct.
metadata	The metadata struct.
local_vector	The local vector in question.
global_vector	The global vector in question.

```
{
    using vec = gko::matrix::Dense<ValueType>;
    auto alpha = gko::initialize<gko::matrix::Dense<ValueType>>(
        {1.0}, settings.executor);
    auto temp_vector = vec::create(
        settings.executor, gko::dim<2>(metadata.local_size, 1),
        (gko::Array<ValueType>::view(
            settings.executor, metadata.local_size,
            &global_vector->get_values()[metadata.first_row
                                             ->get_data()[metadata.my_rank]])),
        1);

    auto temp_vector2 = vec::create(
        settings.executor, gko::dim<2>(metadata.local_size, 1),
        (gko::Array<ValueType>::view(settings.executor, metadata.local_size,
                                     &local_vector->get_values()[0])),
        1);
    if (settings.convergence_settings.convergence_crit ==
        Settings::convergence_settings::local_convergence_crit::
            residual_based) {
        local_vector->add_scaled(alpha.get(), temp_vector.get());
        temp_vector->add_scaled(alpha.get(), local_vector.get());
    } else {
        // TODO GPU: DONE
        temp_vector->copy_from(temp_vector2.get());
    }
}
```

7.4.2.3 setup_windows()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::Communicate< ValueType, IndexType >::setup_windows (
              const Settings & settings,
              const Metadata< ValueType, IndexType > & metadata,
              std::shared_ptr< gko::matrix::Dense< ValueType >> & main_buffer )  [pure virtual]
```

Sets up the windows needed for the asynchronous communication.

Parameters

settings	The settings struct.
metadata	The metadata struct.
main_buffer	The main buffer being exchanged between the subdomains.

Implemented in SchwarzWrappers::SolverRAS< ValueType, IndexType >.

Referenced by SchwarzWrappers::SchwarzBase< ValueType, IndexType >::run().

7.4.2.4 update_boundary()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::Communicate< ValueType, IndexType >::update_boundary (
              const Settings & settings,
              const Metadata< ValueType, IndexType > & metadata,
              std::shared_ptr< gko::matrix::Dense< ValueType >> & local_solution,
              const std::shared_ptr< gko::matrix::Dense< ValueType >> & local_rhs,
              const std::shared_ptr< gko::matrix::Dense< ValueType >> & solution_vector,
              std::shared_ptr< gko::matrix::Dense< ValueType >> & global_old_solution,
              const std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> & interface_↩
matrix )  [pure virtual]
```

Update the values into local vector from obtained from the neighboring sub-domains using the interface matrix.

Parameters

settings	The settings struct.
metadata	The metadata struct.
local_solution	The local solution vector in the subdomain.
local_rhs	The local right hand side vector in the subdomain.
solution_vector	The workspace solution vector.
global_old_solution	The global solution vector of the previous iteration.
interface_matrix	The interface matrix containing the interface and the overlap data mainly used for exchanging values between different sub-domains.

Implemented in SchwarzWrappers::SolverRAS< ValueType, IndexType >.

Referenced by SchwarzWrappers::SchwarzBase< ValueType, IndexType >::run().

The documentation for this class was generated from the following files:

- communicate.hpp (e8c4423)
- /home/runner/work/schwarz-lib/schwarz-lib/source/communicate.cpp (e8c4423)

7.5 SchwarzWrappers::Settings::convergence_settings Struct Reference

The various convergence settings available.

```
#include <settings.hpp>
```

7.5.1 Detailed Description

The various convergence settings available.

The documentation for this struct was generated from the following file:

- settings.hpp (e8c4423)

7.6 CudaError Class Reference

CudaError is thrown when a CUDA routine throws a non-zero error code.

```
#include <exception.hpp>
```

Public Member Functions

- CudaError (const std::string &file, int line, const std::string &func, int error_code)

  Initializes a CUDA error.

7.6.1 Detailed Description

CudaError is thrown when a CUDA routine throws a non-zero error code.

7.6.2 Constructor & Destructor Documentation

7.6.2.1 CudaError()

```
CudaError::CudaError (
            const std::string & file,
            int line,
            const std::string & func,
            int error_code )  [inline]
```

Initializes a CUDA error.

Parameters

file	The name of the offending source file
line	The source code line number where the error occurred
func	The name of the CUDA routine that failed
error_code	The resulting CUDA error code

```
        : Error(file, line, func + ": " + get_error(error_code))
    {}
```

The documentation for this class was generated from the following files:

7.7 CusparseError Class Reference

CusparseError is thrown when a cuSPARSE routine throws a non-zero error code.

```
#include <exception.hpp>
```

Public Member Functions

- CusparseError (const std::string &file, int line, const std::string &func, int error_code)

    Initializes a cuSPARSE error.

7.7.1 Detailed Description

CusparseError is thrown when a cuSPARSE routine throws a non-zero error code.

7.7.2 Constructor & Destructor Documentation

7.7.2.1 CusparseError()

```
CusparseError::CusparseError (
            const std::string & file,
            int line,
            const std::string & func,
            int error_code )  [inline]
```

Initializes a cuSPARSE error.

Parameters

file	The name of the offending source file
line	The source code line number where the error occurred
func	The name of the cuSPARSE routine that failed
error_code	The resulting cuSPARSE error code

```
        : Error(file, line, func + ": " + get_error(error_code))
    {}
```

The documentation for this class was generated from the following files:

7.8 SchwarzWrappers::device_guard Class Reference

This class defines a device guard for the cuda functions and the cuda module.

`#include <device_guard.hpp>`

7.8.1 Detailed Description

This class defines a device guard for the cuda functions and the cuda module.

The guard is used to make sure that the device code is run on the correct cuda device, when run with multiple devices. The class records the current device id and uses `cudaSetDevice` to set the device id to the one being passed in. After the scope has been exited, the destructor sets the device_id back to the one before entering the scope.

The documentation for this class was generated from the following file:

- device_guard.hpp (e8c4423)

7.9 SchwarzWrappers::Initialize< ValueType, IndexType > Class Template Reference

The initialization class that provides methods for initialization of the solver.

```
#include <initialization.hpp>
```

Public Member Functions

- void generate_rhs (std::vector< ValueType > &rhs)

  Generates the right hand side vector.
- void setup_global_matrix_laplacian (const gko::size_type &oned_laplacian_size, std::shared_ptr< gko↩ ::matrix::Csr< ValueType, IndexType >> &global_matrix)

  Generates the 2D global laplacian matrix.
- void partition (const Settings &settings, const Metadata< ValueType, IndexType > &metadata, const std↩ ::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> &global_matrix, std::vector< unsigned int > &partition_indices)

  The partitioning function.
- void setup_vectors (const Settings &settings, const Metadata< ValueType, IndexType > &metadata, std↩ ::vector< ValueType > &rhs, std::shared_ptr< gko::matrix::Dense< ValueType >> &local_rhs, std::shared↩ _ptr< gko::matrix::Dense< ValueType >> &global_rhs, std::shared_ptr< gko::matrix::Dense< ValueType >> &local_solution, std::shared_ptr< gko::matrix::Dense< ValueType >> &global_solution)

  Setup the vectors with default values and allocate mameory if not allocated.
- virtual void setup_local_matrices (Settings &settings, Metadata< ValueType, IndexType > &metadata, std::vector< unsigned int > &partition_indices, std::shared_ptr< gko::matrix::Csr< ValueType, Index↩ Type >> &global_matrix, std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> &local_matrix, std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> &interface_matrix, std::shared_ptr< gko↩ ::matrix::Permutation< IndexType >> &local_perm, std::shared_ptr< gko::matrix::Permutation< IndexType >> &local_inv_perm)=0

  Sets up the local and the interface matrices from the global matrix and the partition indices.

Public Attributes

- std::vector< unsigned int > partition_indices

  The partition indices containing the subdomains to which each row(vertex) of the matrix(graph) belongs to.
- std::vector< unsigned int > cell_weights

  The cell weights for the partition algorithm.

Additional Inherited Members

7.9.1 Detailed Description

template<typename ValueType = gko::default_precision, typename IndexType = gko::int32>
class SchwarzWrappers::Initialize< ValueType, IndexType >

The initialization class that provides methods for initialization of the solver.

Template Parameters

ValueType	The type of the floating point values.
IndexType	The type of the index type values.

Initialization

7.9.2 Member Function Documentation

7.9.2.1 generate_rhs()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::Initialize< ValueType, IndexType >::generate_rhs (
            std::vector< ValueType > & rhs )
```

Generates the right hand side vector.

Parameters

rhs	The rhs vector.

Referenced by SchwarzWrappers::SchwarzBase< ValueType, IndexType >::initialize().

```
{
    std::uniform_real_distribution<double> unif(0.0, 1.0);
    std::default_random_engine engine;
    for (gko::size_type i = 0; i < rhs.size(); ++i) {
        rhs[i] = unif(engine);
    }
}
```

7.9.2.2 partition()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::Initialize< ValueType, IndexType >::partition (
            const Settings & settings,
            const Metadata< ValueType, IndexType > & metadata,
            const std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> & global_←
matrix,
            std::vector< unsigned int > & partition_indices )
```

The partitioning function.

Allows the partition of the global matrix depending with METIS and a regular 1D decomposition.

Parameters

settings	The settings struct.
metadata	The metadata struct.
global_matrix	The global matrix.
partition_indices	The partition indices [OUTPUT].

References SchwarzWrappers::Metadata< ValueType, IndexType >::global_size, SchwarzWrappers::Metadata< ValueType, IndexType >::my_rank, SchwarzWrappers::Metadata< ValueType, IndexType >::num_subdomains, and SchwarzWrappers::Settings::write_debug_out.

Referenced by SchwarzWrappers::SchwarzBase< ValueType, IndexType >::initialize().

```
{
    partition_indices.resize(metadata.global_size);
    if (metadata.my_rank == 0) {
        auto partition_settings =
            (Settings::partition_settings::partition_zoltan |
             Settings::partition_settings::partition_metis |
             Settings::partition_settings::partition_regular |
             Settings::partition_settings::partition_regular2d |
             Settings::partition_settings::partition_custom) &
            settings.partition;

        if (partition_settings ==
            Settings::partition_settings::partition_zoltan) {
            SCHWARZ_NOT_IMPLEMENTED;
        } else if (partition_settings ==
                   Settings::partition_settings::partition_metis) {
            if (metadata.my_rank == 0) {
                std::cout << " METIS partition" << std::endl;
            }
            PartitionTools::PartitionMetis(
                settings, global_matrix, this->cell_weights,
                metadata.num_subdomains, partition_indices);
        } else if (partition_settings ==
                   Settings::partition_settings::partition_regular) {
            if (metadata.my_rank == 0) {
                std::cout << " Regular 1D partition" << std::endl;
            }
            PartitionTools::PartitionRegular(
                global_matrix, metadata.num_subdomains, partition_indices);
        } else if (partition_settings ==
                   Settings::partition_settings::partition_regular2d) {
            if (metadata.my_rank == 0) {
                std::cout << " Regular 2D partition" << std::endl;
            }
            PartitionTools::PartitionRegular2D(
                global_matrix, settings.write_debug_out,
                metadata.num_subdomains, partition_indices);
        } else if (partition_settings ==
                   Settings::partition_settings::partition_custom) {
            // User partitions mesh manually
            SCHWARZ_NOT_IMPLEMENTED;
        } else {
            SCHWARZ_NOT_IMPLEMENTED;
        }
    }
}
```

7.9.2.3 setup_global_matrix_laplacian()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::Initialize< ValueType, IndexType >::setup_global_matrix_laplacian (
              const gko::size_type & oned_laplacian_size,
              std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> & global_matrix )
```

Generates the 2D global laplacian matrix.

Parameters

oned_laplacian_size	The size of the one d laplacian grid.
global_matrix	The global matrix.

Referenced by SchwarzWrappers::SchwarzBase< ValueType, IndexType >::initialize().

```
{
    using index_type = IndexType;
    using value_type = ValueType;
    using mtx = gko::matrix::Csr<value_type, index_type>;
    gko::size_type global_size = oned_laplacian_size *
  oned_laplacian_size;

    global_matrix = mtx::create(settings.executor->get_master(),
                                gko::dim<2>(global_size), 5 * global_size);
    value_type *values = global_matrix->get_values();
    index_type *row_ptrs = global_matrix->get_row_ptrs();
    index_type *col_idxs = global_matrix->get_col_idxs();

    std::vector<gko::size_type> exclusion_set;

    std::map<IndexType, ValueType> stencil_map = {
        {-oned_laplacian_size, -1}, {-1, -1}, {0, 4}, {1, -1},
        {oned_laplacian_size, -1},
    };
    for (auto i = 2; i < global_size; ++i) {
        gko::size_type index = (i - 1) * oned_laplacian_size;
        if (index * index < global_size * global_size) {
            exclusion_set.push_back(
                linearize_index(index, index - 1, global_size));
            exclusion_set.push_back(
                linearize_index(index - 1, index, global_size));
        }
    }

    std::sort(exclusion_set.begin(),
              exclusion_set.begin() + exclusion_set.size());

    IndexType pos = 0;
    IndexType col_idx = 0;
    row_ptrs[0] = pos;
    gko::size_type cur_idx = 0;
    for (IndexType i = 0; i < global_size; ++i) {
        for (auto ofs : stencil_map) {
            auto in_exclusion_flag =
                (exclusion_set[cur_idx] ==
                 linearize_index(i, i + ofs.first, global_size));
            if (0 <= i + ofs.first && i + ofs.first < global_size &&
                !in_exclusion_flag) {
                values[pos] = ofs.second;
                col_idxs[pos] = i + ofs.first;
                ++pos;
            }
            if (in_exclusion_flag) {
                cur_idx++;
            }
            col_idx = row_ptrs[i + 1] - pos;
        }
        row_ptrs[i + 1] = pos;
    }
}
```

7.9.2.4 setup_local_matrices()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::Initialize< ValueType, IndexType >::setup_local_matrices (
            Settings & settings,
            Metadata< ValueType, IndexType > & metadata,
            std::vector< unsigned int > & partition_indices,
            std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> & global_matrix,
            std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> & local_matrix,
            std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> & interface_matrix,
            std::shared_ptr< gko::matrix::Permutation< IndexType >> & local_perm,
            std::shared_ptr< gko::matrix::Permutation< IndexType >> & local_inv_perm )  [pure
virtual]
```

Sets up the local and the interface matrices from the global matrix and the partition indices.

Parameters

settings	The settings struct.
metadata	The metadata struct.
partition_indices	The array containing the partition indices.
global_matrix	The global system matrix.
local_matrix	The local system matrix.
interface_matrix	The interface matrix containing the interface and the overlap data mainly used for exchanging values between different sub-domains.
local_perm	The local permutation, obtained through RCM or METIS.

Implemented in SchwarzWrappers::SolverRAS< ValueType, IndexType >.

Referenced by SchwarzWrappers::SchwarzBase< ValueType, IndexType >::initialize().

7.9.2.5 setup_vectors()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::Initialize< ValueType, IndexType >::setup_vectors (
             const Settings & settings,
             const Metadata< ValueType, IndexType > & metadata,
             std::vector< ValueType > & rhs,
             std::shared_ptr< gko::matrix::Dense< ValueType >> & local_rhs,
             std::shared_ptr< gko::matrix::Dense< ValueType >> & global_rhs,
             std::shared_ptr< gko::matrix::Dense< ValueType >> & local_solution,
             std::shared_ptr< gko::matrix::Dense< ValueType >> & global_solution )
```

Setup the vectors with default values and allocate mameory if not allocated.

Parameters

settings	The settings struct.
metadata	The metadata struct.
local_rhs	The local right hand side vector in the subdomain.
global_rhs	The global right hand side vector.
local_solution	The local solution vector in the subdomain.
global_solution	The global solution vector.

7.10 SchwarzWrappers::Metadata< ValueType, IndexType > Struct Template Reference

The solver metadata struct.

```
#include <settings.hpp>
```

Public Attributes

- MPI_Comm mpi_communicator

  The MPI communicator.
- gko::size_type global_size = 0

  The size of the global matrix.
- gko::size_type oned_laplacian_size = 0

  The size of the 1 dimensional laplacian grid.
- gko::size_type local_size = 0

  The size of the local subdomain matrix.
- gko::size_type local_size_x = 0

  The size of the local subdomain matrix + the overlap.
- gko::size_type local_size_o = 0

  The size of the local subdomain matrix + the overlap.
- gko::size_type overlap_size = 0

  The size of the overlap between the subdomains.
- gko::size_type num_subdomains = 1

  The number of subdomains used within the solver.
- int my_rank

  The rank of the subdomain.
- int my_local_rank

  The local rank of the subdomain.
- int local_num_procs

  The local number of procs in the subdomain.
- int comm_size

  The number of subdomains used within the solver, size of the communicator.

- int num_threads

  The number of threads used within the solver for each subdomain.
- IndexType iter_count

  The iteration count of the solver.
- ValueType tolerance

  The tolerance of the complete solver.
- ValueType local_solver_tolerance

  The tolerance of the local solver in case of an iterative solve.
- IndexType max_iters

  The maximum iteration count of the solver.
- unsigned int precond_max_block_size

  The maximum block size for the preconditioner.
- ValueType current_residual_norm = -1.0

  The current residual norm of the subdomain.
- ValueType min_residual_norm = -1.0

  The minimum residual norm of the subdomain.
- std::vector< std::tuple< int, int, int, std::string, std::vector< ValueType > > > time_struct

  The struct used to measure the timings of each function within the solver loop.
- std::vector< std::tuple< int, std::vector< std::tuple< int, int > >, std::vector< std::tuple< int, int > >, int, int > > comm_data_struct

  The struct used to measure the timings of each function within the solver loop.
- std::shared_ptr< gko::Array< IndexType > > global_to_local

  The mapping containing the global to local indices.
- std::shared_ptr< gko::Array< IndexType > > local_to_global

  The mapping containing the local to global indices.
- std::shared_ptr< gko::Array< IndexType > > overlap_row

  The overlap row indices.
- std::shared_ptr< gko::Array< IndexType > > first_row

  The starting row of each subdomain in the matrix.
- std::shared_ptr< gko::Array< IndexType > > permutation

  The permutation used for the re-ordering.
- std::shared_ptr< gko::Array< IndexType > > i_permutation

  The inverse permutation used for the re-ordering.

7.10.1 Detailed Description

template<typename ValueType, typename IndexType>
struct SchwarzWrappers::Metadata< ValueType, IndexType >

The solver metadata struct.

Template Parameters

ValueType	The type of the floating point values.
IndexType	The type of the index type values.

7.10.2 Member Data Documentation

7.10.2.1 local_solver_tolerance

```
template<typename ValueType, typename IndexType>
ValueType SchwarzWrappers::Metadata< ValueType, IndexType >::local_solver_tolerance
```

The tolerance of the local solver in case of an iterative solve.

The residual norm reduction required.

7.10.2.2 tolerance

```
template<typename ValueType, typename IndexType>
ValueType SchwarzWrappers::Metadata< ValueType, IndexType >::tolerance
```

The tolerance of the complete solver.

The residual norm reduction required.

The documentation for this struct was generated from the following file:

7.11 MetisError Class Reference

MetisError is thrown when a METIS routine throws a non-zero error code.

```
#include <exception.hpp>
```

Public Member Functions

- MetisError (const std::string &file, int line, const std::string &func, int error_code)
  Initializes a METIS error.

7.11.1 Detailed Description

MetisError is thrown when a METIS routine throws a non-zero error code.

7.11.2 Constructor & Destructor Documentation

7.11.2.1 MetisError()

```
MetisError::MetisError (
            const std::string & file,
            int line,
            const std::string & func,
            int error_code )  [inline]
```

Initializes a METIS error.

Parameters

file	The name of the offending source file
line	The source code line number where the error occurred
func	The name of the METIS routine that failed
error_code	The resulting METIS error code

```
        : Error(file, line, func + ": " + get_error(error_code))
    {}
```

The documentation for this class was generated from the following files:

7.12 SchwarzWrappers::SchwarzBase< ValueType, IndexType > Class Template Reference

The Base solver class is meant to be the class implementing the common implementations for all the schwarz methods.

```
#include <schwarz_base.hpp>
```

Public Member Functions

- SchwarzBase (Settings &settings, Metadata< ValueType, IndexType > &metadata)

    The constructor that takes in the user settings and a metadata struct containing the solver metadata.
- void initialize ()

    Initialize the matrix and vectors.
- void run (std::shared_ptr< gko::matrix::Dense< ValueType >> &solution)

    The function that runs the actual solver and obtains the final solution.
- void print_vector (const std::shared_ptr< gko::matrix::Dense< ValueType >> &vector, int subd, std::string name)

    The auxiliary function that prints a passed in vector.
- void print_matrix (const std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> &matrix, int rank, std::string name)

    The auxiliary function that prints a passed in CSR matrix.

Public Attributes

- std::shared_ptr< gko::matrix::Csr< ValueType, IndexType > > local_matrix

  The local subdomain matrix.
- std::shared_ptr< gko::matrix::Permutation< IndexType > > local_perm

  The local subdomain permutation matrix/array.
- std::shared_ptr< gko::matrix::Permutation< IndexType > > local_inv_perm

  The local subdomain inverse permutation matrix/array.
- std::shared_ptr< gko::matrix::Csr< ValueType, IndexType > > triangular_factor

  The local triangular factor used for the triangular solves.
- std::shared_ptr< gko::matrix::Csr< ValueType, IndexType > > interface_matrix

  The local interface matrix.
- std::shared_ptr< gko::matrix::Csr< ValueType, IndexType > > global_matrix

  The global matrix.
- std::shared_ptr< gko::matrix::Dense< ValueType > > local_rhs

  The local right hand side.
- std::shared_ptr< gko::matrix::Dense< ValueType > > global_rhs

  The global right hand side.
- std::shared_ptr< gko::matrix::Dense< ValueType > > local_solution

  The local solution vector.
- std::shared_ptr< gko::matrix::Dense< ValueType > > global_solution

  The global solution vector.

Additional Inherited Members

7.12.1 Detailed Description

template<typename ValueType = gko::default_precision, typename IndexType = gko::int32>
class SchwarzWrappers::SchwarzBase< ValueType, IndexType >

The Base solver class is meant to be the class implementing the common implementations for all the schwarz methods.

It derives from the Initialization class, the Communication class and the Solve class all of which are templated.

Template Parameters

ValueType	The type of the floating point values.
IndexType	The type of the index type values.

7.12.2 Constructor & Destructor Documentation

7.12.2.1 SchwarzBase()

```
template<typename ValueType , typename IndexType >
SchwarzWrappers::SchwarzBase< ValueType, IndexType >::SchwarzBase (
             Settings & settings,
             Metadata< ValueType, IndexType > & metadata )
```

The constructor that takes in the user settings and a metadata struct containing the solver metadata.

Parameters

settings	The settings struct.
metadata	The metadata struct.

7.12.3 Member Function Documentation

7.12.3.1 print_matrix()

```
template<typename ValueType = gko::default_precision, typename IndexType = gko::int32>
void SchwarzWrappers::SchwarzBase< ValueType, IndexType >::print_matrix (
             const std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> & matrix,
             int rank,
             std::string name )
```

The auxiliary function that prints a passed in CSR matrix.

Parameters

matrix	The matrix to be printed.
subd	The subdomain on which the vector exists.
name	The name of the matrix as a string.

7.12.3.2 print_vector()

```
template<typename ValueType = gko::default_precision, typename IndexType = gko::int32>
void SchwarzWrappers::SchwarzBase< ValueType, IndexType >::print_vector (
            const std::shared_ptr< gko::matrix::Dense< ValueType >> & vector,
            int subd,
            std::string name )
```

The auxiliary function that prints a passed in vector.

Parameters

vector	The vector to be printed.
subd	The subdomain on which the vector exists.
name	The name of the vector as a string.

7.12.3.3 run()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::SchwarzBase< ValueType, IndexType >::run (
            std::shared_ptr< gko::matrix::Dense< ValueType >> & solution )
```

The function that runs the actual solver and obtains the final solution.

Parameters

solution	The solution vector.

7.13 SchwarzWrappers::Settings Struct Reference

The struct that contains the solver settings and the parameters to be set by the user.

`#include <settings.hpp>`

Classes

- struct comm_settings

  The settings for the various available communication paradigms.
- struct convergence_settings

  The various convergence settings available.

Public Types

- enum partition_settings

  The partition algorithm to be used for partitioning the matrix.
- enum local_solver_settings

  The local solver algorithm for the local subdomain solves.

Public Attributes

- std::string executor_string
  The string that contains the ginkgo executor paradigm.
- std::shared_ptr< gko::Executor > executor = gko::ReferenceExecutor::create()
  The ginkgo executor the code is to be executed on.
- std::shared_ptr< device_guard > cuda_device_guard
  The ginkgo executor the code is to be executed on.
- gko::int32 overlap = 2
  The overlap between the subdomains.
- bool explicit_laplacian = true
  Flag if the laplcian matrix should be generated within the library.
- bool enable_random_rhs = false
  Flag to enable a random rhs.
- bool print_matrices = false
  Flag to enable printing of matrices.
- bool debug_print = false
  Flag to enable some debug printing.
- bool naturally_ordered_factor = false
  Disables the re-ordering of the matrix before computing the triangular factors during the CHOLMOD factorization.
- std::string metis_objtype
  This setting defines the objective type for the metis partitioning.
- bool use_precond = false
  Enable the block jacobi local preconditioner for the local solver.
- bool write_debug_out = false
  Enable the writing of debug out to file.
- bool write_perm_data = false
  Enable the local permutations from CHOLMOD to a file.
- int shifted_iter = 1
  Iteration shift for node local communication.
- std::string reorder
  The reordering for the local solve.

7.13.1 Detailed Description

The struct that contains the solver settings and the parameters to be set by the user.

settings

7.13.2 Member Data Documentation

7.13.2.1 explicit_laplacian

```
bool SchwarzWrappers::Settings::explicit_laplacian = true
```

Flag if the laplcian matrix should be generated within the library.

If false, an external matrix and rhs needs to be provided

Referenced by SchwarzWrappers::SchwarzBase< ValueType, IndexType >::initialize().

7.13.2.2 naturally_ordered_factor

```
bool SchwarzWrappers::Settings::naturally_ordered_factor = false
```

Disables the re-ordering of the matrix before computing the triangular factors during the CHOLMOD factorization.

Note

This is mainly to allow compatibility with GPU solution.

The documentation for this struct was generated from the following file:

- settings.hpp (e8c4423)

7.14 SchwarzWrappers::Solve< ValueType, IndexType > Class Template Reference

The Solver class the provides the solver and the convergence checking methods.

```
#include <solve.hpp>
```

Additional Inherited Members

7.14.1 Detailed Description

template<typename ValueType = gko::default_precision, typename IndexType = gko::int32>
class SchwarzWrappers::Solve< ValueType, IndexType >

The Solver class the provides the solver and the convergence checking methods.

Template Parameters

ValueType	The type of the floating point values.
IndexType	The type of the index type values.

Solve

The documentation for this class was generated from the following files:

- solve.hpp (e8c4423)
- /home/runner/work/schwarz-lib/schwarz-lib/source/solve.cpp (e8c4423)

7.15 SchwarzWrappers::SolverRAS< ValueType, IndexType > Class Template Reference

An implementation of the solver interface using the RAS solver.

```
#include <restricted_schwarz.hpp>
```

Public Member Functions

- SolverRAS (Settings &settings, Metadata< ValueType, IndexType > &metadata)

  The constructor that takes in the user settings and a metadata struct containing the solver metadata.
- void setup_local_matrices (Settings &settings, Metadata< ValueType, IndexType > &metadata, std::vector< unsigned int > &partition_indices, std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> &global_↩ matrix, std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> &local_matrix, std::shared_ptr< gko↩ ::matrix::Csr< ValueType, IndexType >> &interface_matrix, std::shared_ptr< gko::matrix::Permutation< IndexType >> &local_perm, std::shared_ptr< gko::matrix::Permutation< IndexType >> &local_inv_perm) override

  Sets up the local and the interface matrices from the global matrix and the partition indices.
- void setup_comm_buffers () override

  Sets up the communication buffers needed for the boundary exchange.
- void setup_windows (const Settings &settings, const Metadata< ValueType, IndexType > &metadata, std↩ ::shared_ptr< gko::matrix::Dense< ValueType >> &main_buffer) override

  Sets up the windows needed for the asynchronous communication.
- void exchange_boundary (const Settings &settings, const Metadata< ValueType, IndexType > &metadata, std::shared_ptr< gko::matrix::Dense< ValueType >> &solution_vector) override

  Exchanges the elements of the solution vector.
- void update_boundary (const Settings &settings, const Metadata< ValueType, IndexType > &metadata, std::shared_ptr< gko::matrix::Dense< ValueType >> &local_solution, const std::shared_ptr< gko↩ ::matrix::Dense< ValueType >> &local_rhs, const std::shared_ptr< gko::matrix::Dense< ValueType >> &solution_vector, std::shared_ptr< gko::matrix::Dense< ValueType >> &global_old_solution, const std↩ ::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> &interface_matrix) override

  Update the values into local vector from obtained from the neighboring sub-domains using the interface matrix.

Additional Inherited Members

7.15.1 Detailed Description

template<typename ValueType = gko::default_precision, typename IndexType = gko::int32>
class SchwarzWrappers::SolverRAS< ValueType, IndexType >

An implementation of the solver interface using the RAS solver.

Template Parameters

ValueType	The type of the floating point values.
IndexType	The type of the index type values.

7.15.2 Constructor & Destructor Documentation

7.15.2.1 SolverRAS()

```
template<typename ValueType , typename IndexType >
SchwarzWrappers::SolverRAS< ValueType, IndexType >::SolverRAS (
             Settings & settings,
             Metadata< ValueType, IndexType > & metadata )
```

The constructor that takes in the user settings and a metadata struct containing the solver metadata.

Parameters

settings	The settings struct.
metadata	The metadata struct.
data	The additional data struct.

```
    : SchwarzBase<ValueType, IndexType>(settings, metadata)
{}
```

7.15.3 Member Function Documentation

7.15.3.1 exchange_boundary()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::SolverRAS< ValueType, IndexType >::exchange_boundary (
            const Settings & settings,
            const Metadata< ValueType, IndexType > & metadata,
            std::shared_ptr< gko::matrix::Dense< ValueType >> & solution_vector )  [override],
[virtual]
```

Exchanges the elements of the solution vector.

Parameters

settings	The settings struct.
metadata	The metadata struct.
solution_vector	The solution vector being exchanged between the subdomains.

Implements SchwarzWrappers::Communicate< ValueType, IndexType >.

References SchwarzWrappers::Settings::comm_settings::enable_onesided.

```
{
    if (settings.comm_settings.enable_onesided) {
        exchange_boundary_onesided<ValueType, IndexType>(

7.15.3.2 setup_local_matrices()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::SolverRAS< ValueType, IndexType >::setup_local_matrices (
            Settings & settings,
            Metadata< ValueType, IndexType > & metadata,
            std::vector< unsigned int > & partition_indices,
            std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> & global_matrix,
            std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> & local_matrix,
            std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> & interface_matrix,
            std::shared_ptr< gko::matrix::Permutation< IndexType >> & local_perm,
            std::shared_ptr< gko::matrix::Permutation< IndexType >> & local_inv_perm )  [override],
[virtual]
```

Sets up the local and the interface matrices from the global matrix and the partition indices.

Parameters

settings	The settings struct.
metadata	The metadata struct.
partition_indices	The array containing the partition indices.
global_matrix	The global system matrix.
local_matrix	The local system matrix.
interface_matrix	The interface matrix containing the interface and the overlap data mainly used for exchanging values between different sub-domains.
local_perm	The local permutation, obtained through RCM or METIS.

Implements SchwarzWrappers::Initialize< ValueType, IndexType >.

7.15.3.4 update_boundary()

```
template<typename ValueType , typename IndexType >
void SchwarzWrappers::SolverRAS< ValueType, IndexType >::update_boundary (
            const Settings & settings,
            const Metadata< ValueType, IndexType > & metadata,
            std::shared_ptr< gko::matrix::Dense< ValueType >> & local_solution,
            const std::shared_ptr< gko::matrix::Dense< ValueType >> & local_rhs,
            const std::shared_ptr< gko::matrix::Dense< ValueType >> & solution_vector,
            std::shared_ptr< gko::matrix::Dense< ValueType >> & global_old_solution,
            const std::shared_ptr< gko::matrix::Csr< ValueType, IndexType >> & interface_↩
matrix )  [override], [virtual]
```

Update the values into local vector from obtained from the neighboring sub-domains using the interface matrix.

Parameters

settings	The settings struct.

Parameters

metadata	The metadata struct.
local_solution	The local solution vector in the subdomain.
local_rhs	The local right hand side vector in the subdomain.
solution_vector	The workspace solution vector.
global_old_solution	The global solution vector of the previous iteration.
interface_matrix	The interface matrix containing the interface and the overlap data mainly used for exchanging values between different sub-domains.

Implements SchwarzWrappers::Communicate< ValueType, IndexType >.

7.16 SchwarzWrappers::Utils< ValueType, IndexType > Struct Template Reference

The utilities class which provides some checks and basic utilities.

`#include <utils.hpp>`

7.16.1 Detailed Description

template<typename ValueType = gko::default_precision, typename IndexType = gko::int32>
struct SchwarzWrappers::Utils< ValueType, IndexType >

The utilities class which provides some checks and basic utilities.

Template Parameters

ValueType	The type of the floating point values.
IndexType	The type of the index type values.

Utils

The documentation for this struct was generated from the following files:

- utils.hpp (e8c4423)
- /home/runner/work/schwarz-lib/schwarz-lib/source/utils.cpp (e8c4423)
